PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No.		Applicant(s)	
	10/690,704		SHTEIN ET AL.	
	Examiner		Art Unit	
	David Turocy		1762	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 27 February 2007.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-20 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-20 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 2/27/2007 has been entered.

Response to Amendment

2. Applicant's amendments, filed 2/27/2007, have been fully considered and reviewed by the examiner. The examiner notes the amendment to independent claims, 1 and 11. Claims 1-20 remain pending in the instant application.

3. In view of the papers filed 12/22/2006, it has been found that this nonprovisional application, as filed, through error and without deceptive intent, improperly set forth the inventorship, and accordingly, this application has been corrected in compliance with 37 CFR 1.48(a). The inventorship of this application has been changed by deletion of Joe Michels from the inventive entity.

The application will be forwarded to the Office of Initial Patent Examination (OIPE) for issuance of a corrected filing receipt, and correction of Office records to reflect the inventorship as corrected.

Response to Arguments

4. Applicant's arguments filed 2/27/2007 have been fully considered but they are not persuasive.

Applicant argues against the prior art applied by the examiner, stating that Schmidtt fails to disclose the added claim limitation, specifically, introducing an organic material with a carrier gas into a nozzle and depositing the organic material that is introduced into the nozzle on a substrate. The applicants allege that Schmidtt requires that reactive species precursor be introduced to the nozzle and that the precursor is then reacted and thus the organic material that enters is not deposited. Initially, the examiner notes that the organic material that enters the nozzle, whether reactive or not, does in fact become deposited on the substrate, which is contrary to the applicants allegations. While the organic material is deposited as a polymer and monomer as introduced into the system appears to be moot with regards to the claim was written because the monomer is in fact deposited on the substrate.

Even if the applicants content that the organic material entering the nozzle must not undergo any changes in properties prior to deposition, which is not necessarily required by the claim as written as discussed above, the examiner notes Schmidtt discloses varying alternatives. First Schmidtt discloses that the monomer polymerizes within the jet and it is the examiners position that atleast a portion of the monomers supplied will be deposited on the substrate, where the monomer will effectively be polymerized. Secondly, the examiner has noted previously that the opening (defined by 3-1) of Schmidtt can liberally be read on a nozzle (figure 3, 17-1, 17-2). Therefore,

taking this interpretation, which is clearly reasonable in view of the claim and the specification, Schmidtt does in fact disclose supplying a organic material in a carrier gas to the nozzle (the path formed by walls 3-1 of figure 3 or the passage of figures 17-1 and 17-2). Thereafter the organic material that is supplied to the nozzle within a carrier gas, is ejected and deposited on the substrate, i.e. the organic material entering the orifice is identical in form and property to the organic material deposited. (see also figure 5).

While the examiner notes that Schmidtt describes 1-1 as a nozzle, such a description does not preclude the passage as described above from being considered a nozzle, which as discussed above is in accordance with the claims and the specification. Even in the event that the applicants contend the interpretation as above is erroneous, the examiner maintains that one of ordinary skill in the art would have reasonably expected to successfully provide an organic coating by mixing the reactive species and the organic material prior to entering the entire nozzle structure. Additionally, the examiner would have reasonably expected to successfully deposit a monomer material, without polymerization using the jet deposition technique. The prior art can be modified or combined to reject claims as prima facie obvious as long as there is a reasonable expectation of success. *In re Merck & Co., Inc.*, 800 F.2d 1091, 231 USPQ 375.

Claim Rejections - 35 USC § 103

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

6. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

7. Claims 1-3, 10, 14-18, and 20 are rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent 4788082 by Schmitt ("Schmitt") in view of "Angular Distribution of Flow from Orifices and Tubes at High Knudsen Numbers" by Stickney et al, hereafter Stickney.

Schmitt discloses a process for depositing a film using a carrier gas (Abstract). Schmitt also discloses ejecting a carrier gas, hydrogen or helium, where the flow velocity is on the order of the speed of sound of the carrier gas or about one kilometer

per second, which is greater than 10% of the thermal velocity of the carrier gas (Column 19, lines 59-62). Schmitt discloses depositing organic molecules to form coatings, including polymeric coatings (Column 30, lines 21-38). Schmitt discloses depositing the organic material using an atmospheric background pressure, i.e. 760 Torr, which reads on the background pressures as claimed (Column 21, lines 31-47, Column 24, lines 49-64). It is the examiners position that spraying in an atmospheric pressure environment inherently results in a pressure between the substrate and the nozzle, applicants "dynamic pressure", as claimed. Schmitt also discloses that though high vacuum systems are often complicated they are often utilized when depositing thin films (Column 1, line 66 – Column 2, line 3). Schmitt also discloses providing a depositing species with a molecular weight greater than the carrier gas (Column 11, lines 48-58).

Schmitt fails to disclose providing a nozzle diameter, nozzle length or a nozzle-to-substrate separation about equal to the gas mean free path length. However, Stickney, discloses the angular distribution of the flow through an orifice, when using vacuum technology, is directly related to the Knudsen number, which is defined as the mean free path / diameter of the orifice (Page 10). Stickney discloses the angular distribution of the flow through the orifice becomes increasingly narrow, i.e. more directed, and the center-line intensity increases (page 16). Therefore Stickney discloses the Knudsen number decreases to 1, the angular distribution narrows and the center line intensity increases. In addition, Stickney discloses angular distribution of the spray through a tubular member is a function of the length of the tube as well as the diameter of the tube (Page 16-18). Therefore Stickney clearly discloses the relationship

between the orifice diameter and the mean free path of the gas is a result effective variable.

Therefore it would have been obvious to one skill in the art at the time of the invention was made to determine the optimal value for the Knudsen number, including a Knudsen number about 1, used in the process of Schmitt, through routine experimentation, to provide a spray through an orifice, when using vacuum technology, with the desired angular distribution.

As for the limitation require the, introducing an organic material with a carrier gas into a nozzle and depositing the organic material that is introduced into the nozzle on a substrate: The examiner incorporates by reference in its entirety the remarks from section 3 above.

8. Claims 4-5, 6, 9, and 11-12 are rejected under 35 U.S.C. 103(a) as being unpatentable over Schmitt in view Stickney and further in view of US Patent 6468605 by Shah et al. ("Shah").

Schmitt in view Stickney of teaches all the limitations of these claims as discussed above in the 35 USC 103 (a) rejection, however, Schmitt in view Stickney fails to teach providing a guard flow.

However, Shah teaches of a method for producing a high-speed jet of coating material and gaseous carrier gas (Abstract). Shah discloses providing a guard gas (24) from the nozzle surrounding the gaseous spray (Column 3, line 52-Column 4, line 6,

Figure 1). Shah discloses the guard gas facilitates screening, directing, and shaping of the spray coating to provide the appropriate coating (Column 4, lines 1-2). Shah also discloses using a guard gas including argon and nitrogen (Column 4, lines 3-4). It is the examiners position that the guard gas flow, as disclosed by Shah, would inherently affect the "dynamic pressure" or the pressure between the nozzle and the substrate.

Therefore, it would have been obvious to one skilled in the art at the time of the invention to modify Schmitt in view Stickney to use the guard flow suggested by Shah to provide a desirable high speed spray coating because Schmitt in view Stickney teaches spraying, at high speeds, a coating material entrained in a carrier gas and Shah teaches providing a guard gas provides for shaping, directing, and screening of the coating material entrained in a carrier gas. Please note that the test of obviousness is not an express suggestion of the claimed invention in any or all references, but rather what the references taken collectively would suggest to those of ordinary skill in the art presumed to be familiar with them (*In re Rosselet*, 146 USPQ 183).

Claim 9: Schmitt in view Stickney and further in view of Shah discloses using a guard gas, argon or nitrogen, which has a larger molecular weight than the carrier gas, hydrogen or helium.

9. Claims 7 and 8 are rejected under 35 U.S.C. 103(a) as being unpatentable over Schmitt in view Stickney and Shah and further in view of Kirk-Othmer Vacuum Technology "Kirk-Othmer".

Schmitt in view Stickney and Shah teaches all the limitations of these claims as discussed above in the 35 USC 103 (a) rejection, however, Schmitt in view Stickney and Shah fails to explicitly teach providing a pressure less than 0.1 Torr.

However, Kirk-Othmer, teaching of known uses of vacuum technology, discloses a high vacuum corresponds to a controlled vacuum system (Pg 750, last paragraph). In addition, Kirk-Othmer discloses using various pressures, including pressures less than 0.1 Torr, for various controlled vacuum processes (Table 1). Therefore it is the examiners position that the pressure within the vacuum is a result effective variable, which varies depending on the coating material and substrate.

Therefore it would have been obvious to one skill in the art at the time of the invention was made to determine the optimal pressure within the vacuum chamber, including less than 0.1 Torr, to deposit a thin film as disclosed by Schmitt in view Stickney and Shah, through routine experimentation, to provide the desired coating of a substrate under vacuum conditions.

10. Claims 13 and 19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Schmitt in view Stickney and Shah and further in view of US Patent 5709906 by Bickford et al. ("Bickford").

Schmitt in view Stickney and Shah teach all the limitations of these claims as discussed in the 35 USC 103 (a) rejection above. In addition, Schmitt teaches purging

the system using the inert carrier gas to remove any unwanted species in the system, which might have been there when left open to the ambient environment (Column 21, lines 31-40). However, Schmitt in view Stickney and Shah fails to teach using a glove box.

However, Bickford discloses using a chamber that either can be purged with an inert gas, using an inlet tube and one-way nozzle, or the operation can take place in a glove box under an inert atmosphere (Column 8, lines 53-56). The examiner acknowledges Bickford is direct to electrochemically reducing organic compounds, however, Bickford is only utilized here to show that an inert glove box is a known substitute for purging a chamber prior using a carrier gas. Substitution of equivalents requires no express motivation. *In re Fount*, 213 USPQ 532 (CCPA 1982); *In re Siebentritt* 152, USPQ (CCPA 1967).

Therefore, it would have been obvious to one skilled in the art at the time of the invention to modify Schmitt in view Stickney and Shah to use the glove box with an inert gas atmosphere suggested by Bickford to provide a desirable inert atmosphere without unwanted species because Schmitt in view Stickney and Shah teaches purging the spray chamber with inert gas prior to applying the coating and Bickford teaches a glove box with an inert atmosphere is a known substitute for inert gas purge of a chamber.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to David Turocy whose telephone number is (571) 272-

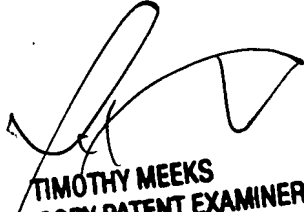

Art Unit: 1762

2940. The examiner can normally be reached on Monday-Friday 8:30-6:00, No 2nd Friday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Timothy Meeks can be reached on (571) 272-1423. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
